

Bonus :

Modularity of the App : to see commits of other projects , we need to modify the variable deposit in (js/script.js) , we could also define new services , actually we only have (getCommit) but we could add other functions , then all what we need is to write new functions in the service

Design : As there is a lot of fields , we choose which fields we want to see by clicking on them , they we can hide them again by clicking .Some css Tricks (hover..)

Routing (I defined a routage in the application ng route) , users who try to access to other page , would be redirected to an error page .

Sorting By Name or date : When You click on the field name or date it sorts the table (but actually It works only the first Time , I didn't have time to correct the bug)

Image Of the Committer : If the User has profil picture than its printed else we see a beautiful smile
